Abstract

This report describes the use of L^AT_EX to format a thesis. A number of topics are covered: content and organization of the thesis, L^AT_EX macros for controlling the thesis layout, formatting mathematical expressions, generating bibliographic references, importing figures and graphs, generating graphs in MATLAB, and formatting tables. The L^AT_EX macros used to format a thesis (and this document) are described.

Acknowledgments

Acknowledge this, asshole.

Preface

There are some things I should probably pre-face, certainly not reface.

Chapter 1

Introduction & Motivation

“In order that our tools, and their uses, develop effectively: (A) we shall have to give still more attention to doing the approximately right, rather than the exactly wrong...” (Tuckey 1965)

Throughout the vast majority of human history the term “musical instrument” has signified both the physical object with which the musician interacted *and* the direct source of the sound created: a violin with vibrating strings, a reeded saxophone, a timpani with its membrane, etc. With the advent of electronic sound in the late 19th century, it became possible for interactive objects to be separated from the sound producing devices they control (Chadabe 2000). As technological development progressed, so did the capacity to divide musical instruments into independent parts. With digitization it is now not only possible to arbitrarily connect a control element to any sound synthesis dimension, but also to modify this association according to the whims of the user. Since mechanical linkages are no longer necessary in the design of musical instruments, control surfaces can, and often do, take on a variety of wild and arbitrary shapes and modes of interaction.¹ All that is necessary for this process is for control devices to output some kind of electronic signal that other, sound-producing instruments can accept. With no obvious means of implementation, the success or failure of these new digital musical instruments (DMIs) often depends on how artfully their output signals are “mapped” to synthesis parameters.

More and more frequently, the mapping itself becomes a part of the expressive element

¹International Conference on New Interfaces for Musical Expression. [Online]. Available: <http://www.nime.org/>. Accessed June 23, 2013.

of a musical work (Hunt and Kirk 2000), as it associates itself with both composition and performance with certain DMIs. Thus it becomes necessary for mapping to be dynamic and interactive: sometimes poured over in composition studios, or sometimes edited mid-piece. Musicians are not necessarily computer programmers, thus ideally the act of mapping should not require computer expertise. This means that on top of the low-level layer of interactive mapping (simply instructing a machine to connect signals to others in specific ways), there needs to exist an interface to make such an activity easy, logical, intuitive and in line with the artistic process.

As the actual act of mapping is as expansive and nebulous as the instruments it hopes to assist, thus the design of such a mapping interface presents many interesting challenges. Due to the tremendously wide variety of possible use cases, several seemingly contradictory goals emerge: What is the best way to visually represent complex musical networks while simultaneously allowing for the user to easily manipulate them? How can systems with many devices and signals be well represented while still allowing in-depth control of small networks? How can an interface be transparent to non-technical users while still accommodating all possible functionality that advanced users may wish to use?

1.1 Context and Motivation

The world of digital musical instruments is still dominated by keyboard type input devices. Though many novel DMIs currently exist (and many more are being created) these devices are usually unique and often difficult to use without their creator being present (Cook 2009). Since mapping is such an important feature of DMIs, a means of transparently editing them could inspire more people to use novel musical controllers. In response to this challenge, the libmapper protocol was created at the Input Devices and Music Interaction Laboratory (IDMIL) (Malloch et al. 2008). The tool is summarized by its website as follows:

“libmapper is an open-source, cross-platform software library for declaring data signals on a shared network and enabling arbitrary connections to be made between them. libmapper creates a distributed mapping system/network, with no central points of failure, the potential for tight collaboration and easy parallelization of media synthesis. The main focus of libmapper development is

to provide tools for creating and using systems for interactive control of media synthesis.”²

In its most basic state, libmapper takes the form of an application programming interface (API). APIs are primarily a means for different pieces of computer software to communicate with one another. The only possible way to communicate directly with the libmapper API is through coded text. For example, the following portion of code causes a synthesizer to announce itself and begin communicating with other devices on a libmapper-enabled network (Malloch et al. 2008):

```
#include <mapper.h>
mapper_admin_init();
my_admin = mapper_admin_new("tester", MAPPER_DEVICE_SYNTH, 8000);
mapper_admin_input_add(my_admin, "/test/input", "i")
mapper_admin_input_add(my_admin, "/test/another_input", "f"))

// Loop until port and identifier ordinal are allocated.
while ( !my_admin->port.locked || !my_admin->ordinal.locked )
{
    usleep(10000); // wait 10 ms
    mapper_admin_poll(my_admin);
}

for (;;)
{
    usleep(10000);
    mapper_admin_poll(my_admin);
}
```

Fig. 1.1 A sample of libmapper code

This is obviously inaccessible to users who do not have the time or desire to read through documentation files, or those who have no knowledge of programming semantics. A steep learning curve is especially a problem for a network tool like libmapper: because it is primarily a means of communication between instruments, it can only be successful if it is widely adopted. A libmapper-enabled controller will only be useful if many high quality libmapper synthesizers exist. In turn, synthesizer makers will only have incentive

²libmapper: a library for connecting things. [Online]. Available: libmapper.org. Accessed June, 2013

to incorporate libmapper into their designs if there are already controllers that use the system.

An API can be contrasted with a graphical user interface (GUI), an interface that contains abstractions on top of the raw code. These abstractions can be features like buttons, menus, visual representations of data, etc. In general, GUIs are designed to be familiar to those who have used digital devices in the past, and thus easy to learn and use. Two GUIs have been created for libmapper (see section 2.4.4): a basic interface built in Max/MSP³ and vizmapper (Rudraraju 2011), a more abstract representation of a libmapper network. Both of these GUIs have their strengths, yet neither adequately meets the full range of possible use cases for libmapper. A more flexible approach is required if the GUI is to be usable in situations with hundreds of signals, transparent for systems with multi-leveled hierarchical devices, intuitive during performances where devices output light and haptic feedback as well as sound, and responsive for tasks where speed of manipulation is an absolute necessity.

With such an interface in place, libmapper can greatly expand its user base. As a result, more controller and synthesizer designers may choose to incorporate libmapper into their devices, and in turn these devices will be easier to learn and use. Hopefully the end result will be greater adoption of non keyboard-based DMIs in the electronic music community.

1.2 Project Overview

The focus of this project is to create a graphical user interface for libmapper. This interface aims to be flexible and intuitive, simultaneously allowing for useful control of the full range of possible libmapper networks while also not intimidating non-technical users with complexity. The presupposed solution to this problem is to provide users with multiple independent modes of viewing and interacting with the network. Certain view modes can excel in providing precise control, while others can help users understand the structure of complex networks. The idea is to provide multiple imperfect solutions to an unsolvable problem, so that each can be “...approximately right, rather than exactly wrong” (Tuckey).

This project was structured in four major, non-sequential parts: a review of prior visualized mapping interfaces, the integration of presently available GUIs for libmapper, the

³MAX: You make the machine that makes your music. [Online]. Available: <http://cycling74.com/>. Accessed June 17, 2013

extension of interface features and the collection of user feedback. Results of the research phase informed implementation and are presented here. Development began by updating a cross-platform implementation of the current Max/MSP-based GUI, while integrating functionality from vizmapper. New view modes were integrated into design while refining functionality of the previous ones. Throughout the design process, the GUI was provided to potential users who gave feedback on the strengths, weaknesses and potential avenues for improvement.

1.3 Thesis Overview

The remainder of this document is organized as follows. Chapter 2 outlines concepts necessary for providing context for this thesis project. A wide variety of domains inform the creation of a musical mapping interface. Special attention is paid to mapping theory, data visualization, relevant existing user interfaces, user centric design techniques and specifics of libmapper itself. Chapter 3 describes the design and implementation of the libmapperGUI. This chapter presents design decisions made, technical details of implementation and how the user-centric approach informed the process. Chapter 4 evaluates results, both on the empirical level of software performance as well as qualitative user feedback. Finally, Chapter 5 presents conclusions of the work and suggests further developments for the software.

1.4 Contributions

The contributions of this thesis are: the exploration of issues related to user interface design for musical mapping networks, the design and implementation of an interface for libmapper that aims to improve on usability and flexibility of the system, and this thesis document, which describes the research and development therein.

Chapter 2

Background

Dynamic mapping is becoming an increasingly important requirement for digital musical instruments. This chapter surveys currently available tools that allow for manipulation of musical and non-musical networks in real time. The first section presents a review of mapping itself, both from a theoretical and a musical standpoint. This portion also introduces the libmapper application programming interface. The second section reviews relevant work in the visual representation of information. The third section of this chapter describes applicable techniques in user interface design. Finally, a review of user interfaces for mapping is presented.

2.1 Mapping

At the most fundamental level, *mapping* is the act of associating two or more sets of information. Mappings can be mathematical, computational, linguistic (like translation), geographic, or even poetic¹. Within the context of DMI design mapping is the relationship between sensor outputs and synthesis inputs. The entire character of a new instrument can be drastically altered through mapping, even while control surface and sound source are held constant (Hunt et al. 2003). As a result, the theoretical formalism of mapping becomes yet another necessary tool in the modern instrument designer's arsenal.

¹What is metaphor if not the association of unlike things?

2.1.1 Mapping Theory

From the perspective of mathematics, the term *mapping* is very nearly synonymous with *function* (Halmos 1970), as both describe how one set of numbers corresponds with another. The first group is commonly referred to as the *domain* and the second as the *codomain* or *range*. An in-depth description review of functions in mathematics is beyond the scope of this thesis, however a few fundamental examples will be useful for reference in section 2.1.2. The following are examples of the four basic types of mathematical functions,² as relevant to musical mapping:

$$y = x + 1 \tag{2.1}$$

$$y = x^2 \tag{2.2}$$

$$y = \pm\sqrt{x} \tag{2.3}$$

$$y = \pm\sqrt{1 - x^2} \tag{2.4}$$

As we can see in

2.5 Summary

Chapter 3

Design & Implementation

Development of a graphical user interface for libmapper creates a unique challenge. Obviously such an interface is a practical tool, and should function as such, yet it also must work in concert with DMIs which are inherently designed for abstract and creative use. For the purposes of this project, the assumed solution to this innate paradox is to provide the user with multiple independent modes of control. This assumption was made based on experiences with prior user interfaces for libmapper (vizmapper, max mapperGUI): for each interface users reported excellent functionality for certain use cases, and poor functionality for others. Libmapper itself is an extremely flexible API that makes few assumptions as to the network of devices and signals, nor how they are being mapped. It is fitting that a GUI for libmapper would be equally as flexible. In lieu of a single perfect solution for network visualization and interactivity, providing users with various independent solutions provided a good compromise.

3.1 User Centric Design

use cases

3.2 Development of a “Modular” Interface

3.3 The Model-View-Controller

Because a modular design is desired, the Model-View-Controller (MVC) metaphor for structuring software applications as described in [KrasnerPope88] was used as a general framework for structuring the application. In fact, the whole scale swapping in and out of independent visual modes can be thought of as a quintessential implementation of MVC.

3.3.1 The Model

The model consists of an abstract copy of the network, residing on the local machine. Independent views can consult this data, but cannot directly modify it.

3.3.2 Controller-View Pairs

3.4 Graphical Design
